

Overband Crack Seal & Micro-Slurry Resurfacing

An economical way to resurface your asphalt pavement!

If your asphalt lot or road has cracks or alligatored areas, you need help. Seal the cracks with an Overband Crack Seal and then resurface the entire lot with economical Micro-Slurry Surface.

Micro-Slurry is a cold mixed process that adds a new high asphalt content surface that withstands the sun and water damage. Applied at 15 pounds of aggregate per square yard, it is 1/4" thick and gives you a new, skid resistant uniform surface that hides all patches and crack sealing.

A Micro-Slurry machine mixes and applies the material on the pavement. The material does minor rut filling and fills and seals small holes. You can resurface with Micro-Slurry for a fraction of the cost of a hot mix overlay. The skid resistant surface makes driving and walking safer. Slurry fills open cracks while hot mix overlays bridge cracks. Overband Crack Sealing is a recommended pretreatment before resurfacing. Micro-Slurry seals the surface and prevents moisture from penetrating the base, the ultimate cause of major repairs.

We will be happy to examine your pavement and recommend what repairs or resurfacing may be needed. There are many roads, parking lots, and surfaces to which we can point you for examples of our work.
