

# Spray Patch: Win the War Against Potholes and Large Cracks

The new technology in Spray Patching uses a machine that removes the loose debris out of cracks or potholes with 250 cubic feet per minute forced air. The same nozzle, with the opening of a valve, applies a hot asphalt emulsion seal/tack.

With the flip of a switch, a high quality aggregate is coated with a polymer modified asphalt and then shot into the crack or hole at 50 MPH, producing compaction tested to 94%.

The key to success in any pothole and large crack repair is to begin with an area that has been cleaned, tacked, filled, and compacted. Our Spray Patching system does all this with just one machine and two operators.

Give us a call today to learn more about our Spray Patching system—a low cost solution with long term results.
